                  J. Biol. Chem. 267:4664-4671(1992).
-!- FUNCTION: MAY BE INVOLVED IN TISSUE INJURY AND REMODELING. HAS SIGNIFICANT ELASTOLITIC ACTIVITY.
-!- CATALYTIC ACTIVITY: HYDROLYSIS OF SOLUBLE AND INSOLUBLE ELASTIN.
SPECIFFIC CLEAVAGES ARE ALSO PRODUCED AT 14-ALA-|-LEU-15 AND 16-TYR-|-LEU-17 IN THE B CALLO PRODUCED.
-!- COFACTOR: REQUIRES CALCIUM AND ZINC FOR ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-AUG-1992 (Rel. 23, Created)

**A sarco/endoplasmic reticulum Ca(2+)-ATPase 3-type Ca2+ pump is expressed in platelets, in lymphoid cells, and in mast cells.;

J. Biol. Chem. 269:1410-1416(1994).

-!- FUNCTION: THIS MAGNESIUM DEPENDENT ENTYME CATALYZES THE HYDROLYSIS OF ATP COUDLED WITH THE TRANSPORT OF THE CALCIUM. TRANSPORTS CALCIUM IONS FROM THE CYTOSOL INTO THE SARCOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPLASMIC/ENDOPL

Macrophage elastase (EC 3.4.24.-) precursor - mouse
N.Alternate names: matrix metalloproteinase 12 (MMP12)
C.Species: Mus musculus (house mouse)
C.Saccession: A42401
R.Shapiro. S.D.; Griffin, G.L.; Gilbert, D.J.; Jenkins, N.A.; Copeland, N.G.; Welgus, J. Biol. Chem. 267, 4664-4671, 1992
A;Title: Molecular cloning, chromosomal localization, and bacterial expression of a m. A;Reference number: A42401; MUID:92165826
A;Title: Molecule type: mRNA
A;Molecule type: mRNA
A;Molecule type: mRNA
A;Residues: 1-462 <SHA>
A;Cross-references: GB:M82831; NID:9199127; PIDN:AAA39526.1; PID:9199128
C;Superfamily: intersitial collagenase; hemopexin repeat homology; matrix metalloproteinase homology <AMP>F;35.256/Domain: matrix metalloproteinase homology <AMP>F;35.256/Domain: matrix metalloproteinase homology <AMP>F;365-21/Binding site: zinc, catalytic (Cys, His, His, His, His) (inhibited) #stat
F;211,215,221/Binding site: zinc, catalytic (His) (active) #status predicted
F;212/Active site: Glu #status predicted
                                                                                                                                                                          hypothetical protein ZK994.5 - Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Species: Caenorhabditis elegans

                                                                                                                                                                                                                                                                      Gaps
Huntingtin interacting protein HIP1 (W18030) is a brain-specific protein that interacts differently with the gene product of a normal (16 CAG repeat) and an expanded (over 44 CAG repeat) Huntington's disease (HD) gene, and which facilitates incorporation of huntingtin into brain cell membranes. Its amino acid sequence was deduced from a human frontal cortex CDNs clone (16187). The effects of HD in a patient expressing huntingtin protein with an expanded polyglutamine tract can be ameliorated by increasing the amount of expressed HIP1 in the brain using gene therapy approaches. Modified forms of HIP1 which bind more effectively to expanded HD protein can be used to convert the expanded protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Huntingtin Interacting Protein (HIP), that

Proteins with DED (referred as HIP-apoptosis modulating proteins) are useful for inducing apoptotic death in cells. The HIP is a logical target for therapy in Huntington's disease since it has a differential apoptotic activity, modulated by interaction with Huntingtin having normal and expanded repeats. HIP is also used as a therapeutic agent to introduce apoptosis in cancer cells. Increasing expression of normal (non-expanded) HIP-apoptotic modulator: binding portion, a modified HIP-apoptotic modulator: Thinding portion, a modified treating Huntington's disease. The present sequence represents the human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Includes a death effector domain (DED), suggesting apototic function. Proteins with DED (referred as HIP-apotosis modulating proteins) are useful for inducing apoptotic death in cells. The HIP is a logical target for therapy in Huntington's disease since it has a differential apoptotic activity, modulated by interaction with Huntingtin having normal and expanded repeats. HIP is also used as a therapeutic agent to introduce apoptosis in cancer cells. Increasing expression of normal (non-expanded) Huntingtin or the HIP-apoptotic modulator-binding portion, a modified
```

```
The invention relates to Huntingtin Interacting Protein (HIP), that includes a death effector domain (DED), suggesting apototic function. Proteins with DED (referred as HIP-apoptosis modulating proteins) are useful for inducing apoptotic death in cells. The HIP is a logical target for therapy in Huntington's disease since it has a differential apoptotic activity, modulated by interaction with Huntingtin having normal and expanded repeats. HIP is also used as a therapeutic agent to introduce apoptosis in cancer cells. Increasing expression of normal (non-expanded) Huntingtin or the HIP-apoptotic modulator-binding portion, a modified HIP-apoptotic modulator in which the DED has been deleted, is helpful for treating Huntington's disease. The present sequence represents the mouse
                                                                                                                           Novel proteins useful for treating Huntington's disease by gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cDNA encoding Huntington's disease interacting protein - useful to ameliorate effects of disease in patient expressing Huntingtin protein with expanded CAG repeat region

IV-C) encoded by the DNA contained within the vector pc3-hPDE IV-C. The full length wild type hPDE IV-C coding sequence (see T99951) was isolated from a human testis CDNA library. Cyclic phosphodiesterase enzymes (PDEs) are a family of enzymes that catalyse the degradation of cyclic nucleotides. Cyclic nucleotides are important intracellular second messengers. This sequence can be used to produce the recombinant isoenzyme, which may be useful in PDE IV activity assays. The recombinant improved therapeutics in the areas of asthma and inflammation. Primers determined from this sequence, that are specific for hPDE IV-C, can be used in a nassay for detecting hPDE IV-C in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 phosphodiesterase IV-C) isoenzymes. The DNA encoding these sequences was isolated from a human testis cDNA library. The DNA encoding these sequences expressed by a host cell, can be used to determine the sequences of hDDE IV-C specific primers. The primers can be used for detecting the presence of hDDE IV-C in human cells. The host cell line can be used to identify compounds or other substances that inhibit or modify the activity of hDDE IV-C. The screening can identify drugs that may be improved therapeutics for treating asthma and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human phosphodiesterase IV isoenzyme hPDE IV-C - used to identify PDE inhibitors that may be used for treating asthma and inflammation

```
phosphodiesterase IV-C) isoenzymes. The DNA encoding these sequences was isolated from a human testis cDNA library. The DNA encoding these sequences expressed by a host cell, can be used to determine the sequences of hPDE IV-C specific primers. The primers can be used for detecting the presence of hPDE IV-C in human cells. The host cell line can be used to identify compounds or other substances that inhibit or modify the activity of hPDE IV-C. The screening can identify drugs that may be improved therapeutics for treating asthma and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphodiesterase IV isoenzyme; hPDE IV-C; human; PDE; enzyme; therapy; cyclic nucleotide degradation; intracellular; second messenger; asthma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the full length sequence for human phosphodiesterase IV isoenzyme (hPDE IV-C). The DNA encoding this sequence was isolated from a human testis cDNA library. Cyclic phosphodiesterase enzymes (PDES) are a family of enzymes that catalyse the degradation of cyclic nucleotides. Cyclic nucleotides are important intracellular second messengers. This sequence can be used to produce the recombinant isoenzyme, which may be useful in PDE IV activity assays. The recombinant isoenzyme may also be used in screening assays for drugs that may be improved therapeutics in the areas of asthma and inflammation. Primers determined from this sequence, that are specific for hPDE IV-C, can be used in a RT-PCR amplification, in an assay for detecting hPDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; cyclic nucleotide phosphodiesterase IV-C; isoenzyme; therapy; asthma; inflammation; hPDE IV-C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes new isolated RAS-related polypeptides and mammalian cyclic nucleotide phosphodiesterases (PDEs). RAS-related polypeptides are capable of complementing a defective RAS function in polypeptides are capable of complementing a defective RAS function in yeast. The products can be used for screening for agents which can modify, complement or suppress a genetic defect in a biochemical pathway which capable will which cAMP participates, or in a blochemical pathway which is controlled, directly or indirectly, by a RAS protein and other proteins affecting cell growth and maintenance. Developing agents that will selectively act upon PDEs is directed toward reproducing the increased myocardial contractility, anti-inflammation, yet without causing the undesirable effects, e.g. increased heart rate or enhanced lipolysis. The products can also be used for therapeutic, diagnostic and prognostic uses. 232294 to 232285, and Y49803 to Y49830, represent contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated RAS-related polypeptides and mammalian cyclic nucleotide phosphodiesterases, used for screening for agents which can modify complement or suppress genetic defects \,

W34310-W34312 represent hPDE IV-C (human cyclic nucleotide phosphodiesterase IV-C) isoenzymes. The DNA encoding these sequences was isolated from a human testis cDNA library. The DNA encoding these sequences capressed by a host cell, can be used to determine the sequences of hPDE IV-C specific primers. The primers can be used for detecting the presence of hPDE IV-C in human cells. The host cell line can be used to identify compounds or other substances that inhibit or modify the activity of hPDE IV-C. The screening can identify drugs that may be improved therapeutics for treating asthma and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phosphodiesterase IV isoenzyme; hPDE IV-C; human; PDE; enzyme; therapy; cyclic nucleotide degradation; intracellular; second messenger; asthma; inflammation.

                                      A novel 7-transmembrane receptor (W12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG34. It shows 48.2% homology to the human PTH receptor. Its from a claid sequence was deduced from a cDNA clone (T56619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG34 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hyperphosphataemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Antagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, hypophosphataemia, kidney stone, nephroliasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Complementary screening for genes and prods. - e.g. RAS protein and cAMP, that modify, complement or suppress genetic defect and correct associated phenotypic alteration
hyper-calcaemia, hypo- or hyper-phosphatemia, kidney stones, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    In the specification this sequence is given the SEQ ID NO. 43 which is described as the nucleotide (!) sequence of the insert from plasmid pPDE21 which encodes a member of the cAMP-specific phosphodlesterase family.

-1-FUNCTION: AGGREGATES KERATIN INTERMEDIATE FILAMENTS DND PROMOTES
DISULFIDE-BOND FORMATION OF MAMMALIAN EPIDEMIS.
-1-FTM: FILAGGRIN IS INITIALLY SYNTHESIZED AS A LARGE, INSOLUBLE,
HIGHLY PHOSPHORYLAATED PRECURSOR CONTAINING MANY TANDEM COPIES
OF 324 AA, WHICH ARE NOT SEPARATED BY "LARGE LINKER". THE
PRECURSOR IS DEPOSITED AS KERATOHYALIN GRANULES. DURING TERMINAL
DIFFERENTIATION IT IS DEPHOSPHORYLATED & PROTEOLYTICALLY CLEAVED.

I. CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
I- SIMILARITY: OO THER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE FES/FPS SUBFAMILY.
I- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE FES/FPS SUBFAMILY.
-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
